# **Table of contents**

Executive summary	2
Analysis and findings	2
Thread activity – StartAddress function	7
Thread activity – sub_7FF668CDF870 function	8
Case 1 – File size < 5244992 bytes (approximately 5MB)	12
Case 2 – File size > 5244992 bytes (approximately 5MB)	13
Case 3 – Modify the encryption percentage using the "-ep" parameter	14
Indicators of Compromise	16

# **Executive summary**

Royal ransomware is a recent threat that appeared in 2022 and was particularly active during recent months. The ransomware deletes all Volume Shadow Copies and avoids specific file extensions and folders. It encrypts the network shares found in the local network as well as the local drives. A parameter called "-id" that identifies the victim and is also written in the ransom note must be specified in the command line.

The files are encrypted using the AES algorithm (OpenSSL), with the key and IV being encrypted using the RSA public key that is hard-coded in the executable. The malware can fully or partially encrypt a file based on the file's size and the "-ep" parameter. The extension of the encrypted files is changed to ".royal".

## **Analysis and findings**

SHA256: f484f919ba6e36ff33e4fb391b8859a94d89c172a465964f99d6113b55ced429

The malware is a 64-bit executable that is not packed. It retrieves the command-line string for the process using the GetCommandLineW API:

CODD7FE6665CDD044     FF 15 8E E5 18 00     Call qword ptr ds:[ckGetCommandLinew>]     C	>	Default (x64 fastcall) 🔻 5 💠 🗌 Unk	ocke
<pre>qword ptr [00007FF668E6C2D8 <malware.&getcommandlinew>]=<kernel32.getcommandlinew></kernel32.getcommandlinew></malware.&getcommandlinew></pre>	1: rcx 00007FF668C60000 malware.00007FF668C60000 2: rdx 000000000000000		

#### Figure 1

CommandLineToArgvW is utilized to obtain an array of pointers to the command line arguments, as highlighted below:

#### Figure 2

The process compares the arguments with "-path", "-id", and "-ep". The "-id" parameter is mandatory and consists of 32 characters that could be a victim ID. In this case, any 32 characters value can be specified (see figure 3).

#### Figure 3

The ransomware deletes all Volume Shadow Copies by spawning a vssadmin.exe process:

00007FF668CD0E39     00007FF668CD0E43     00007FF668CD0E43     00007FF668CD0E43     00007FF668CD0E82     00007FF668CD0E82     00007FF668CD0E82     00007FF668CD0E84     00007FF668CD0E84     00007FF668CD0E84     00007FF668CD0E84     00007FF668CD0E82     00007FF668CD0E82     00007FF668CD0E82     00007FF668CD0E82     00007FF668CD0E82     00007FF668CD0E84     00007FF668CD0E82     00007FF668CD0E82     00007FF668CD0E82     00007FF668CD0E82     00007FF668CD0E82     00007FF668CD0E82     00007FF668CD0E82     00007FF668CD0E84     00007FF668CD0E84     00007FF668CD0E82     00007FF668CD0E82     00007FF668CD0E82     00007FF668CD0E82     00007FF668CD0E82     00007FF668CD0E82     00007FF668CD0E82     00007FF668CD0E82	44         80         95         CO         68         000         1ear (rak, qword ptr ss: [rbp-2C], eax           89         45         000         86         62         23         00         1ear (rx, qword ptr ss: [rbp-6C], rax           48         80         00         86         62         24         00         wor word ptr ss: [rbp-6C], rax           48         80         42         60         wor word ptr ss: [rbp-6C], rax         wor word ptr ss: [rbp-4C], rax           48         80         42         60         wor r8d, r6d         mov qword ptr ss: [rbp-4C], rax           48         80         42         43         mov qword ptr ss: [rbp-4C], rax         wor r8d, r6d           48         80         42         70         hear ax, qword ptr ss: [rbp-4C], rax         wor word ptr ss: [rbp-3C], r12           48         80         42         70         mov qword ptr ss: [rbp-3C], r12         wor word ptr ss: [rbp-3C], r12           46         89         42         80         64         82         mov qword ptr ss: [rbp-3C], r12           46         80         42         80         64         82         mov qword ptr ss: [rbp-3C], r12           47         80         64         82         8	10         DE3 0025         DE5 0052         DE3 0028           10         DE3 0026         DE3 0028         DE3 0028           10         DE3 0007FF668CDC140         malware.00007FF668CDC140           10         DE3 000000000000000         DE3 000000000000000000000000000000000000

The malware decrypts a list of extensions that will be skipped:

- .exe
- .dll
- .bat
- .lnk
- .royal

A list of directories to be skipped is also decrypted:

- windows
- royal
- \$recycle.bin
- google
- perflogs
- mozilla
- tor browser
- boot
- \$windows.~ws
- \$windows.~bt
- windows.old

The executable initiates the use of the Winsock DLL via a function call to WSAStartup:

qword ptr [00007FF668E6C578 <malwar< th=""><th>e.&amp;WSAStartup&gt;]=<ws2_< th=""><th>32.WSAStartup&gt;</th><th></th><th>1: rcx 000000000000202 2: rdx 000000152D5089A0</th><th></th></ws2_<></th></malwar<>	e.&WSAStartup>]= <ws2_< th=""><th>32.WSAStartup&gt;</th><th></th><th>1: rcx 000000000000202 2: rdx 000000152D5089A0</th><th></th></ws2_<>	32.WSAStartup>		1: rcx 000000000000202 2: rdx 000000152D5089A0

#### Figure 18

The malicious executable dequeues an I/O completion packet from the I/O completion port by calling the GetQueuedCompletionStatus API:

#### Figure 19

The WSAAddressToStringW routine is utilized to extract the reachable IP addresses from the sockaddr structures:

#### Figure 20

The ransomware enumerates the network shares that are different than "ADMIN\$" and "IPC\$":

# **Thread activity – StartAddress function**

GetLogicalDrives is used to obtain the currently available disk drives (see figure 22).

Figure 22

A ransom note called "README.txt" is created in every drive (0x40000000 = GENERIC\_WRITE):

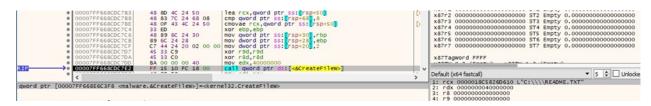

Figure 23

The ransom note containing the "-id" parameter is populated using the WriteFile routine:

Figure 37

The encrypted content is written back to the file, followed by the AES key and IV that were encrypted using the RSA public key:

#### Figure 39

Finally, the ransomware writes the file length and a value representing the encryption

percentage to the file (0x64 = 100%, i.e. the entire file was encrypted):

Figure 44

# Case 3 – Modify the encryption percentage using the "-ep" parameter

Royal ransomware can modify the percentage of the file content to be encrypted. For example, we've set the "-ep" parameter to 10, and the malware only encrypts 10% of the file, as highlighted below.
